Questionnaire

## PRESENTATION

Tobacco is the single largest cause of avoidable death in the European Union, accounting for more than half a million deaths every year and more than a million in Europe as a whole. It is estimated that $25 \%$ of all cancer deaths and $15 \%$ of all deaths in the European Union could be attributed to smoking. In order to curb this epidemic, the European Union is actively developing a comprehensive tobacco control policy, based on legislative measures, prevention and cessation activities, and mainstreaming tobacco control into a range of other Community policies.

There is considerable media focus on tobacco consumption and its dangers, and numerous international anti-tobacco campaigns have been organised in recent years.

The aim of this survey, commissioned by the Directorate-General Health and Consumer Protection of the European Commission is to assess the attitude of Europeans to tobacco. It is not the first survey on this subject. The last such survey was carried out in autumn 2002. The current questionnaire has, however, been considerably redrafted in relation to the previous survey and only a few questions can be used to draw comparisons.

The main themes addressed in this survey are:

- the level and frequency of tobacco consumption,
- the behaviour and opinion of smokers and non-smokers with regard to places where people smoke,
- the attitude and opinion of Europeans to tobacco smoke and its harmful effects,
- the extent to which smokers combine tobacco with other substances,
- and, finally, the impact and effectiveness of anti-tobacco campaigns on smokers and those who have given up smoking.

This survey was carried out in two stages:

- in September and October 2005 in the 25 European Union Member States,
- in November and December 2005 in the two accession countries (Bulgaria and Rumania), the two candidate countries (Croatia and Turkey) and the Turkish Cypriot Community.

It was commissioned by thee Directorate-General Health and Consumer Protection of the European Commission and carried out by TNS Opinion \& Social, a consortium formed by TNS and EOS Gallup Europe. The methodology used was that of the Standard Eurobarometer surveys of the Directorate-General Press and Communication ("Opinion Polls, Press Reviews, Europe Direct" unit). A technical note concerning the interviews carried out by the institutes of the TNS Opinion \& Social network is annexed to this report. That note specifies the interview method used, as well as the intervals of confidence ${ }^{1}$.

[^0]
## 1. Smoking in the European Union

### 1.1. Tobacco consumption in the European Union

Questionnaire source: Q1

## -A clear majority of European Union citizens do not smoke-

In the autumn 2005 survey, almost half (47\%) of European Union citizens declared that they have never smoked and one in five (21\%) admits having stopped smoking. Packed cigarettes are the most attractive product for smokers and more than a quarter ( $27 \%$ ) of respondents seems to smoke them. The consumption of other products is far more marginal: only $5 \%$ of the people interviewed smoke rollup cigarettes and $1 \%$ smoke cigars.

Q1 Which of the following applies to you?
$\square$ Aut. 2002/ EU15 (EB58.2) $\square$ Aut. 2005/ EU15 ■ Aut. 2005/ UE25

## -The number of smokers has fallen considerably over the last three years-

The scores in the 2005 survey are similar between the enlarged European Union and the 15 old Member States. In the 15 old Member States, compared with autumn 2002, there has been a significant fall in the number of smokers of packed cigarettes ( -7 points). On the other hand, the number of respondents declaring that they have never smoked has increased considerably ( +5 points). Are the younger generations less attracted by tobacco? In addition, the number of people who have stopped smoking has increased.

### 1.1.1. People who have never smoked

An analysis of the results by country shows that levels of consumption vary considerably between the Member States. In roughly half the Member States, more than one out of two people interviewed declared that they have never smoked. The highest scores in this group of people were recorded in several Mediterranean countries, notably Portugal (58\%), Malta (56\%) and Cyprus (56\%). On the other hand, the Danes (38\%) and the Dutch (40\%) have the highest scores in terms of those who have already smoked.

In the accession and candidate countries, Rumania (57\%) and Turkey (55\%) have the highest levels of consumption.

## -Compared with 2002 a larger number of respondents have never smoked-

Compared with the last survey in 2002, the number of respondents declaring that they have never smoked has increased in 11 of the 15 countries which participated in the survey at that time. This increase in particularly striking in Finland $(+12$ points), the United Kingdom ( +10 points) and the Netherlands ( +9 points). The number of people who declare that they have never smoked has also increased in Denmark (+4 points).

## -A majority of women declare that they have never smoked-

An analysis of the socio-demographic variables reveals that women smoke less than men: $57 \%$ of women state that they have never smoked, compared with only $36 \%$ of men. The youngest (56\%) and oldest (52\%) respondents also seem to have been less tempted by tobacco, as well as people looking after the home (61\%) and students (63\%).

## Q1 Which of the following applies to you? Answer: You have never smoked

-Aut. 2002
■ Aut. 2005

### 1.1.2. Smokers of packed cigarettes

## -Contrasting results in consumption, with a very sharp drop in several Member States-

The level of consumption of packed cigarettes also varies considerably between Member States. Greeks (40\%) and Austrians (37\%) are the biggest consumers of packed cigarettes, closely followed by citizens of a majority of the new Member States (6 countries where at least $30 \%$ of the respondents smoke packed cigarettes).
On the other hand, barley one citizen in five in Sweden (18\%), the Netherlands (19\%) and Belgium (20\%) smokes this type of product.

The scores recorded in the accession and candidate countries are higher than those of the European Union countries, notably in the Turkish Cypriot Community (44\%) and Bulgaria (38\%).

## -There has been a marked fall in the consumption of packed cigarettes since 2002-

Compared with the survey carried out in 2002, there has been a very noticeable fall in the consumption of packed cigarettes in a majority of the 15 old Member States, in particular in the United Kingdom ( -11 points), France ( -11 points) and Spain ( -10 points). On the other hand, consumption levels have even increased slightly in Austria and Greece (+1 point).

Q1 Which of the following applies to you? Answer: You smoke packed cigarettes

■Aut. 2002
■ Aut. 2005

An analysis of socio-demographic variables reveals that $31 \%$ of men smoke packed cigarettes compared with $23 \%$ of women. On the other hand, tobacco consumption seems to be far lower among the oldest respondents ( 55 and over) than among age groups (over fifty percent fewer).

Unemployed people (45\%) and manual workers (38\%) also have noticeably higher levels of consumption than the other socio-professional categories.

## Q1 Which of the following applies to you? Answer: You smoke packed cigarettes

### 1.1.3. People who have stopped smoking

## -The situation varies from one Member State to another-

The proportion of respondents who declare that they have stopped smoking varies considerably between Member States (see next page). Although just over one in ten respondents seems to have given up smoking in Cyprus (12\%) and Portugal (13\%), at least one in four has given up smoking in the Netherlands (30\%), Denmark (27\%) and the United Kingdom (25\%).

## -The number of smokers who have stopped smoking has increased since 2002-

In a majority of the 15 old Member States, the proportion of respondents who have stopped smoking has increased since autumn 2002. The highest increases in this regard were recorded in the United Kingdom ( +6 points), Germany ( +5 points), Luxembourg (+4 points) and France ( +4 points).

The percentage of respondents who state that they have stopped smoking in the accession and candidate countries is below the European average. This percentage is particularly low in Turkey (8\%) and the Turkish Cypriot Community.

Q1 Which of the following applies to you? You used to smoke but you have stopped

ロAut. 2002
■ Aut. 2005

In 2005, a large percentage of men (25\%) seem to have stopped smoking. Older people also seem more likely to have stopped smoking. While $7 \%$ of the $15-24$ age group declare that they have stopped smoking, the corresponding percentage is almost $23 \%$ among 40-54 year olds and $30 \%$ in the oldest group ( 55 and over). From a socio-professional point of view, retired people have the highest score ( $32 \%$ ) among people having giving up smoking, with a score that is twice as high as that of unemployed people and people looking after the home (15\%).

Q1 Which of the following applies to you? You used to smoke but you have stopped

### 1.2. Frequency of tobacco consumption

Questionnaire source: Q2, Q3

### 1.2.1. Regularity of tobacco consumption

## -Smoking is not an occasional habit-

In the European Union a very clear majority of smokers ${ }^{2}$ (84\%) declare that they smoke regularly. The chart below highlights a slight reduction in this regularity in the 15 old Member States between 2002 and 2005 (- 3 points).

## Q2 Do you smoke regularly, or occasionally?

An analysis of the results by country (see chart on the next page) shows a high level of regularity in tobacco consumption throughout the Member States. It varies between $76 \%$ in Malta and $90 \%$ or more in Portugal (90\%), Greece (91\%) and Hungary (92\%).

The regularity of this consumption is similar in the accession and candidate countries.

Compared with 2002, this regularity has declined in several countries, notably in Belgium ( -9 points), Italy and the United Kingdom ( -8 points). On the other hand, it seems to have increased in Sweden (+7 points) and Germany (+ 4 points).

[^1]Q2 Do you smoke regularly, or occasionally? Answer: Regularly
-Aut.2002/EU15 (EB 58,2) ■ Aut. 2005

An analysis of the results from a socio-demographic point of view does not reveal any significant differences between the categories studied. It is to be noted, however, that the youngest respondents, students and managers seem to be more occasional smokers than the others categories.

### 1.2.2. Frequency and quantity of cigarettes smoked per day

## -Cigarette smokers smoke every day-

In all Member States, more than $90 \%$ of cigarette smokers ${ }^{3}$ declare that they smoke every day, except in Sweden ( $87 \%$ ). The percentage is even almost $100 \%$ in Cyprus (99\%) and Portugal (98\%).

## Q3 Do you smoke every day? (IF YES) How many cigarettes a day do you smoke?

(Answers "no, do not smoke every day" and "DK" are not represented on this graph.)

| $\square$ Yes, 40 or more cigarettes a day |  |  |
| :--- | :--- | :--- |
| $\square$ Yes, 35 to 39 cigarettes a day | $\square$ Yes, 30 to 34 cigarettes a day |  |
| $\square$ Yes, 25 to 29 cigarettes a day | $\square$ Yes, 20 to 24 cigarettes a day | $\square$ Yes, 15 to 19 cigarettes a day |
| $\square$ Yes, 10 to 14 cigarettes a day | $\square$ Yes, 5 to 9 cigarettes a day | $\square$ Yes, less than 5 cigarettes a day |

[^2]
## -Mixed levels of consumption in Europe-

As regards the number of cigarettes smoked on a daily basis, the chart shown above highlights that there are clear differences in levels of consumption between the various countries. Based on, for example, the categories of replies of more than 20 cigarettes a day, it is clear that a majority of Cypriots and Greeks smoke more than 20 cigarettes a day, while this percentage is less than $20 \%$ in Slovakia, Estonia and Lithuania.

These differences are also highlighted by the calculation of the average number of cigarettes smoked daily. Consumption varies among cigarette smokers and can be nearly twice as high, for example between Cyprus ( 23.2 cigarettes a day) and Slovakia (12.2).

In comparison to the results of the survey carried out in autumn 2002, the average number of cigarettes smoked daily has fallen in a majority of countries, notably in Belgium (-3.4), France (-2.2) and Luxembourg (-2.2). However, these changes are not significant on the whole.

Finally, Swedish citizens stand out by the increase (+1.7) in the average number of cigarettes smoked every day.

Q3 Do you smoke every day? (IF YES) How many cigarettes a day
do you smoke?
Average number of cigarettes per day
-Aut. 2002 ■Aut. 2005

A socio-demographic analysis of the average number of cigarettes smoked reveals significant differences.

## -Women and young people smoke less and their consumption has fallen the most since 2002-

Women (13.3 cigarettes a day) smoke less than men (16.2) and the level of their consumption has fallen more sharply than that of men.

People aged over 40 smoke more than the youngest respondents and their consumption has fallen less than that of the youngest age group.

It seems that the earlier the respondents finished their full-time education, the higher their daily consumption of cigarettes. Compared with 2002, this consumption does not seem to have fallen among respondents who stopped full-time education the earliest (before or at the age of 15).

Finally, it seems that students smoke less than others.

Q3 Do you smoke every day? (IF YES) How many cigarettes a day do
you smoke?
Average number of cigarettes per day

## 2. Places where people smoke tobacco

Questionnaire source: Q6, Q7, Q8

### 2.1. Smoking at home

Questionnaire source: Q6 - Filtered question

## -Four out of five Europeans smoke at home-

Some $80 \%$ of smokers ${ }^{4}$ in the European Union declare that they smoke at home. This percentage varies considerably from one Member State to another: from 50\% in Finland to $92 \%$ in Hungary. In most countries, this percentage exceeds 70\%, and only Finland (50\%), Lithuania (60\%) and the Czech Republic (64\%) stand out by lower percentage of people who smoke at home.

Q6 Do you smoke at home?

[^3]
### 2.2. Smoking in the car

Questionnaire source: Q7 - Filtered question

## -A certain consideration for non-smokers and children as regards smoking in the car-

Almost $80 \%$ of smokers ${ }^{5}$ in the European Union declare that they do not smoke in the car when they are in the company of children. A majority (58\%) of them also do not smoke when they are in the company of non-smokers. On the other hand, more than half of smokers declare that they smoke in the car when they are on their own.

Q7 Do you smoke when you are in a car...?
(EU25)
$\square$ Yes $\square$ No $\quad$ It depends (SPONTANEOUS) $\square D K$

[^4]
### 2.2.1. Smoking when alone in the car

-Each country has its own approach-

Although for the European Union as a whole, 54\% of respondents declare that they smoke when in the car, this percentage varies from 37\% in Sweden to almost 75\% in Ireland (73\%) and Greece (73\%). Moreover, the high percentage of smokers from Mediterranean countries (in the EU and non-EU) among those who declare the most frequently that they smoke in the car when they are alone is noteworthy.

Q7 Do you smoke when you are in a car...? When you are alone

An analysis of the results by socio-demographic variables shows clearly that among smokers, women (47\%) smoke less than men (60\%) when they are alone in the car. That also applies to the oldest age group (39\%) and in particular is true among respondents who declare that they are occasional smokers (23\%).

Q7 Do you smoke when you are in a car...? When you are alone

### 2.2.2. Smoking in the car in the company of non-smokers

## -The consideration shown to non-smokers is fairly inconsistent between countries -

In 20 of the 25 Member States, a majority of respondents declare that they do not smoke in the car in the company of non-smokers. The proportion is as high as almost four out of five respondents in the Netherlands (82\%) and Sweden (80\%).

On the other hand, citizens in Ireland (47\%) and Greece (49\%) seem, as with the previous point, to be the most likely to declare that they smoke in the car, even if, in this case, the circumstances are different.

Q7.2 Do you smoke when you are in a car in the company of nonsmokers?

Among smokers, once again, it is the oldest age group (19\% - 55 and over) and occasional smokers who smoke noticeably less than others when they are in the car, in particular in the company of non-smokers. Women (25\%) and the respondents who studied the longest (24\%) are also the least likely to smoke in such a context.

Q7.2 Do you smoke when you are in a car in the company of nonsmokers? Answer: yes

### 2.2.3. Smoking in the car in the company of children

## -Widespread consideration for children-

As regards smoking in the car in the presence of children, a strong majority of smokers declare that they do not smoke in such circumstances. In 15 of the 25 Member States, more than four out of five respondents seem to follow this rule. That percentage is as high as $91 \%$ in Sweden and Slovakia.

On the other hand, more than 20\% of Spaniards (24\%) and Greeks (21\%) continue to smoke in the car in the company of children. It is also noteworthy that in the candidate countries, a higher percentage of people smoke in the company of children in Croatia (26\%) and Turkey (25\%).

Q7.3 Do you smoke when you are in the company of childrens?

Smokers with the highest level of education (11\%), retired people (11\%), students ( $9 \%$ ) and mangers (11\%) smoke less often than others when there are children in the car. Occasional smokers (5\%) are the least likely to smoke in such circumstances.

## Q7.3 Do you smoke when you are in the company of childrens? Answer: yes

### 2.3. Banning smoking in public places

Questionnaire source: Q8

## -A strong majority of European citizens are in favour of a ban on smoking in public places-

On the whole, a majority of European Union citizens seem to be in favour of banning smoking in public places.

More than four out of five respondents take that view as regards smoking in offices and other indoor workplaces (86\%), as well as in any indoor public spaces (84\%). For those places, more than $60 \%$ of the people interviewed are even totally in favour of a ban.

Q8. Are you in favour of smoking bans in the following places? (EU25)

Support for a ban seems to be less clear-cut in the case of restaurants, bars and pubs. Although, in the case of restaurants, a majority of respondents (56\%) are once again fully in favour of such a ban, the corresponding percentage is only $40 \%$ in the case of bars and pubs. For the latter, just over a third of the people interviewed seem to be against such a ban.

### 2.3.1. Banning smoking in restaurants

## -A general consensus in most countries in favour of a ban on smoking in restaurants-

In almost all the Member States, European Union citizens are in favour of banning smoking in restaurants. This proportion is in excess of 90\% in Malta (93\%), Ireland ( $93 \%$ ) and Slovenia ( $91 \%$ ). In a majority of Member States, more than half of the respondents are even very much in favour of such a ban on smoking.

The Czech Republic is the only country where a majority of citizens (50\%) are opposed to a ban on smoking on restaurants.

Q8.1 Are you in favour of smoking bans in the following places? Answer: Restaurants

## -More than eight of ten non-smokers are in favour of a ban on smoking in restaurants-

Almost $88 \%$ of people who have never smoked, as well as $83 \%$ of those who have stopped smoking are in favour of a ban on smoking in restaurants, compared with $55 \%$ of smokers. People who smoke roll-up cigarettes ( $48 \%$ ) seem to be the least in favour to such a ban.

Q8.1 Are you in favour of smoking bans in the following places? Answer: Restaurants

A socio-demographic analysis reveals that support for a ban on smoking in restaurants is highest among women ( $79 \%$ versus $74 \%$ for men), the oldest respondents (83\%) and people looking after the home (81\%).

### 2.3.2. Banning smoking in bars and pubs

## -Opinions are more divided on a ban on smoking in bars and pubs-

Opinions of Europeans are far more divided on the question of introducing a ban on smoking in bars and pubs. Although more than $80 \%$ of citizens in Italy ( $88 \%$ ), Sweden ( $82 \%$ ) and Ireland ( $82 \%$ ) are in favour of such a ban, the level of support is only $35 \%$ in the Czech Republic, $42 \%$ in Austria and $46 \%$ in Germany.

Q8.2 Are you in favour of smoking bans in the following places? Answer: Bars or Pubs

Once again, women (66\%) are more likely than men (57\%) to support a ban on smoking in bars and pubs. The older the respondents, the more they seem to support such a ban. Finally, it is noteworthy that students (54\%), manual workers (54\%) and unemployed people (47\%), and people living in large cities are among those that are the least in favour of this measure.

Although a majority of non-smokers are in favour of a ban on smoking in bars and pubs, a minority (35\%) of smokers support such a ban. People who smoke roll-up cigarettes ( $21 \%$ ) seem to be the least receptive to these measures.

## Q8.2 Are you in favour of smoking bans in the following places? Answer: Bars or Pubs

### 2.3.3. Banning smoking in offices and other indoor workplaces

## -All Member States are strongly in favour of a ban on smoking in offices and other indoor workplaces-

There is a general consensus in all Member States on the subject of banning smoking in offices and other indoor workplaces. In all countries, more than twothirds of citizens are in favour of such a ban. In 23 of the 25 EU Member States, and in all the accession and candidate countries, a majority of respondents are very much in favour of such a ban.

More than four out of five respondents in Sweden (90\%), Finland (86\%) and Malta ( $84 \%$ ) are totally in favour of a ban on smoking in offices and other indoor workplaces.

Q8.3 Are you in favour of smoking bans in the following places?
Answer: Offices, and other indoor workplaces

The socio-demographic results do not reveal any particular divisions on this question. However, it is to be noted, once gain, that women ( $89 \%$ ) are more in favour than men ( $84 \%$ ) of banning smoking. The same is true as regards the oldest age group.

## -A strong majority of smokers in favour of banning smoking in offices and other indoor workplaces-

Three-quarters of smokers (75\%) and almost more than 90\% of non-smokers are in favour of banning smoking in offices and other indoor workplaces.

Q8.3 Are you in favour of smoking bans in the following places? Answer: Offices, and other indoor workplaces

2.3.4. Banning smoking in any indoor public space (metro, airports, shops, etc.)

## -A majority of citizens in all countries are in favour of banning smoking in all indoor public spaces -

Although the proportion is not as high in this case as for indoor workplaces, a majority of citizens in all the countries participating in the survey are in favour of banning smoking in all public places. Once again, citizens in Sweden (85\%), Finland ( $83 \%$ ) and Malta ( $79 \%$ ) tend to be the most in favour of such a ban. Likewise, citizens in the Czech Republic (50\%) and above all in Austria (37\%) seem, as was the case for indoor workplaces, slightly less favourable than the others to such a ban. Resistance to such a measure is the strongest in the Czech Republic (20\% of respondents are totally against the idea).

Q8.4 Are you in favour of smoking bans in the following places? Answer:
Any indoor public space (metro, airports, shops, etc.)

Women ( $87 \%$ versus $82 \%$ of men) and older people ( $87 \%$ among people aged 55 and over) tend once again to be slightly more in favour of such a ban. On the other hand, unemployed people ( $79 \%$ ) are slightly less so. On the whole, the results reveal no significant differences in socio-demographic terms.

The fact of being a smoker or a non-smoker seems, on the other hand, to be a more cleaving aspect. Although overall a majority or respondents are in favour of a ban on smoking in indoor public spaces, such as metros, airports and shops, as the chart below shows, $91 \%$ of people who have never smoked are in favour of such measures compared with $72 \%$ of smokers. These results are fairly similar to those noted with regard to workplaces, with however slightly lower "in favour" rates of replies (by approximately 3 points) for each category of replies.

## Q8.4 Are you in favour of smoking bans in the following places? Answer: <br> Any indoor public space (metro, airports, shops, etc.)

## 3. Exposure to tobacco smoke

Questionnaire source: Q9, Q10, Q4, Q5 and Q12.1

### 3.1. The nuisance of tobacco smoke

Questionnaire source: Q9

## -Respondents are divided on the question of the bother caused by exposure to tobacco smoke-

On the question of the bother caused by exposure to tobacco smoke, a majority of European Union Citizens (57\%) declare that they are rarely (30\%) or never (27\%) bothered by it (see the chart on the next page).

There are however particularly marked cleavages of opinion from one Member State to another. Citizens in Malta (64\%), Cyprus, Italy and Slovakia (54\%) seem to be the most bothered by exposure to tobacco smoke.

On the other hand, respondents in the Nordic countries do not seem to be bothered by tobacco smoke. Approximately a quarter of citizens in Finland (25\%) and Sweden ( $24 \%$ ) declare that they are sometimes or very often bothered by such exposure. It is also noteworthy that almost four out of ten citizens (39\%) in France, Luxembourg and Ireland declare that they have never been bothered by cigarette smoke.

In the candidate and accession countries, citizens in Turkey (62\%) and Rumania (54\%) notably seem to be particularly averse to the nuisance of tobacco smoke.

Q9 How often are you bothered by exposure to tobacco smoke in your daily life?

An analysis of the socio-demographic variables reveals significant differences in the replies to this question.

## -The younger the respondents the more they seem to be bothered by tobacco smoke

Women (45\%) seem to be slightly more bothered than men by tobacco smoke in their daily life. However, the age of respondents seems to be a significant factor in terms of difference in the reaction to tobacco smoke: the youngest respondents seem to be the most bothered by tobacco smoke in their daily life (53\% in the 1524 age group).

This aversion of young people to tobacco smoke is confirmed by the particularly high rate of positive replies (57\%) among students. The respondent's level of education and socio-professional category also translate certain differences of opinion, but to a lesser extent.

The following categories also seem to be less bothered by tobacco smoke: retired people (33\%), unemployed people (37\%) and people who left school at an early age (38\%).

Finally, it is to be noted that people who have never smoked (53\%) are twice as likely as smokers (26\%) to admit to being bothered by tobacco smoke.

In addition, those who have stopped smoking (44\%) seem to be frequently bothered by other people's smoke.

### 3.2. Why are people bothered by tobacco smoke?

Questionnaire source: Q10 - filtered question

## -People seem to more bothered by the unpleasant aspects of tobacco smoke rather than by health considerations -

A majority of European Union citizens bothered by tobacco smoke ${ }^{6}$ mentioned the unpleasant aspects of tobacco smoke, such as its smell, as the reason why it bothers them. On the other hand, they mentioned less frequently the possibility that tobacco smoke can cause certain physical symptoms (27\%) or that exposure to tobacco smoke could make certain health problems worse (9\%).

Q10 Why does this exposure to tobacco bother you ?

[^5]In most countries, the fact that people are bothered by exposure to tobacco smoke in their daily life is explained in the majority of cases by the unpleasant aspects of such smoke. The physical symptoms caused by tobacco smoke are mentioned slightly less frequently.

In the Baltic countries and Poland (68\%), more than two-thirds of the people interviewed mentioned the unpleasant aspects of tobacco smoke to explain why they object to it. On the other hand, in Greece (46\%), Turkey (52\%) and Malta ( $55 \%$ ), the physical symptoms are the most frequently mentioned reason.

## -The unpleasant aspects of tobacco smoke are more frequently mentioned by young people-

An analysis of the descriptive variables (see chart on the next page) shows that the unpleasant aspects of tobacco smoke are more often mentioned by young people (60\%), students (62\%) and managers (62\%). On the other hand, such aspects are less frequently mentioned by the oldest respondents ( $52 \%$ among those aged 55 and over) and consequently by retired people (50\%), people who place themselves on the left of the political spectrum (54\%), smokers (54\%) and above all smokers who roll their own cigarettes (42\%).

## -Health related problems more frequently mentioned by the oldest respondents-

The physical symptoms caused by tobacco smoke seem, on the other hand, to be more mentioned by women (29\%), the oldest respondents (30\%) and retired people ( $32 \%$ ), people who place themselves on the left of the political spectrum ( $31 \%$ ), and above all by cigar or pipe smokers (37\%).

The respondents who mentioned a recognised health problem are logically the oldest respondents and retired people (14\%), as well as, to a lesser extent, people who have stopped smoking (11\%).

Q10 Why does this exposure to tobacco bother you ?

### 3.3. Asking smokers not to smoke

Questionnaire source: Q4

## -Approximately one in two Europeans asks smokers not to smoke near them-

European Union citizens seem fairly divided on the question of asking smokers not to smoke in front of them. Although $48 \%$ never ask a smoker not to smoke near them, $52 \%$ do so, at least sometimes. Approximately one in five European Union citizens (22\%) often or always makes such a request.

Q4 Do you ever ask a smoker not to smoke near you because it bothers you? ... ?

## -Tolerance towards smokers varies considerably from one country to another-

In two-thirds of the Member States, a majority of respondents declare that they ask smokers not to smoke in their presence. Citizens in Turkey ( $70 \%$ ), Malta ( $66 \%$ ), the Turkish Cypriot Community ( $66 \%$ ) and Italy ( $61 \%$ ) are the most likely to react in this way. On the other hand, a majority of citizens in Ireland (64\%), Finland ( $58 \%$ ) and the United Kingdom ( $56 \%$ ) never make such a request.

If we add together the number of "sometimes" and "never" replies, it is clear that a clear majority of respondents in all the countries either do not react or react only to a limited extent, and demonstrate a certain tolerance towards smokers.

Women (55\%) are more likely than men (48\%) to ask smokers not to smoke. That reaction is also slightly more frequent among students and those who studied the longest (57\%). Managers (59\%), people who look after the home (57\%) and other white collar employees are also more inclined to adopt this reaction.

Q4 Do you ever ask a smoker not to smoke near you because it bothers you?
Answer: Yes

### 3.4. The discomfort and harm caused by tobacco smoke to non-smokers

Questionnaire source: Q5

## -3/4 of EU citizens are aware that tobacco smoke can be harmful for non-smokers-

Approximately three-quarters of European Union citizens think that other people's smoke can be a health risk, either by causing serious illnesses such as cancer (39\%) or by causing health problems such as respiratory problems (33\%).

Although the danger of other people's smoke is not always perceived, it seems that in all the Member States, a majority of respondents are aware of the dangers of passive smoking.

Although one respondent in five believes that tobacco smoke can disturb other people, only $3 \%$ seem not to be aware of the dangers of tobacco smoke.

An analysis by country reveals significant differences of opinion between Member States. In Sweden 84\% of citizens think that tobacco smoke can cause either serious illnesses such as cancer (55\%), or respiratory problems (29\%). That point of view is shared by $80 \%$ of respondents in Finland and France. On the other hand, only a small majority of Austrians ( $54 \%$ ) see second-hand smoke as a health risk. Moreover, less than a quarter of respondents in Portugal (24\%), Austria (24\%) and Greece ( $21 \%$ ) believe that other people's smoke can lead in the long term to serious illnesses such as cancer.

In the accession and candidate countries, citizens in Rumania and above all the Turkish Cypriot Community seem particularly badly-informed about the health risks of other people's smoke.

The results obtained reveal no significant differences in socio-demographic terms. It is to be noted, however, than women ( $76 \%$ ) seem more aware than men ( $69 \%$ ) of the health risks of other people's smoke.

Q5 Do you think that, for the non-smoker, other people's smoke...?
$\square$ Can even, in the long term, cause serious illnesses such as cancer

- Can cause some health problems such as respiratory problems
- Can cause discomfort
- Is harmless
- It depends (SPONTANEOUS)
- DK

### 3.5. The dangers of tobacco smoke for pregnant women

Questionnaire source: Q12.1. et Q12.2.

## -95\% of EU citizens believe that smoking in the presence of pregnant women can be very dangerous for the baby-

Almost 95\% of European Union citizens seem to agree with the statement that smoking in the presence of a pregnant woman can be very dangerous for the baby. Almost three-quarters (74\%) of respondents even declared that they totally agree with this statement.

More than $80 \%$ of respondents in all the countries which participated in the survey are aware of this danger. There are, however, significant differences of opinion when only the "totally agree" category of answers are taken into consideration. The scores in this category vary from 55\% in Austria and the Netherlands to 86\% in Cyprus and Hungary, $87 \%$ in the Turkish Cypriot Community and $92 \%$ in Turkey.

Q12.1 Dans quelle mesure êtes-vous d'accord avec les affirm ations suivantes?
Réponse: Fumer en présence d'une femme enceinte peut être très dangereux pour le bébé

A socio-demographic analysis of the results does not reveal any significant differences on this point. All the categories studied seem to recognise the dangers of tobacco smoke for pregnant women.

## -Drinking 1 or 2 glasses of wine per day during pregnancy is seen as less dangerous than cigarette smoke-

Although a slight majority of European Union citizens (51\%) do not seem to agree with the statement that drinking 1 or 2 glasses of wine a day during pregnancy is harmless to the baby, it is interesting to note that they do not perceive the dangers of drinking wine in the same way as exposure to cigarette smoke.

Q12.2 To what extend do you agree or disagree with each of the following statements?
To drink 1 or $\mathbf{2}$ glasses of wine per day during pregnancy is harmless to the baby

```
\squareTotally agree \squareTend to agree \squareTend to disagree ם Totally disagree \squareDK
```

## -The harmful effects of wine are perceived very differently from one European country to another-

Unlike tobacco smoke, the harmful effects of wine are perceived very differently from one Member State to another. Although more than three-quarters of citizens in the Czech Republic (76\%) and a majority of Spaniards (69\%) and Italians (59\%) believe that wine tends to be harmless, only $13 \%$ of Swedish citizens take that view. More than $71 \%$ of the latter totally disagree with the statement that drinking one or two glasses of wine a day during pregnancy is harmless. In the same way, three-quarters of Finnish citizens and more than two-thirds of citizens in Luxembourg (69\%) and Germany (68\%) do not agree with that statement.

## -The youngest respondents and those having the highest level of education are the most sensitive to the dangers of drinking wine for pregnant women -

There seem to be fairly clear cleavages depending on the respondent's age and level of studies. Older people and those who left school at a fairly early age seem more inclined to support the view that drinking wine on a regular basis is harmless to the baby.

Q12.2 To drink 1 or $\mathbf{2}$ glasses of wine per day during pregnancy is harmless to the baby Answer: agree

## 4. Combining tobacco with other harmful products

Questionnaire source: Q11 - filtered question

## -Alcohol is the only harmful product that a majority of smokers combine with tobacco-

In the European Union, $57 \%$ of smokers ${ }^{7}$ combine tobacco and alcohol very often ( $20 \%$ ) or sometimes ( $37 \%$ ).

On the other hand, $87 \%$ of smokers never combine tobacco with cannabis or any other drug, and $50 \%$ never combine it with medicines.

## Q11 How often do you combine tobacco with...?

(EU 25)

[^6]
### 4.1. Tobacco and alcohol

## -Frequently combined in a majority of Member States-

In 23 of the 25 Member States, a majority of smokers combine tobacco and alcohol sometimes or very often.

This combination varies considerably from one Member State to another. More than $80 \%$ of citizens in Finland (82\%) and Ireland (81\%) sometimes combine alcohol with tobacco and $51 \%$ and $43 \%$ respectively of them do so very often. On the other hand, less than $10 \%$ of Italians ( $9 \%$ ) and Hungarians ( $8 \%$ ) declare that they very often mix alcohol and tobacco.

In the accession and candidate countries, citizens seem to combine tobacco with alcohol the least frequently in the Turkish Cypriot Community (43\%) and above all in Turkey (31\%). This result is probably linked to the culture of those two countries.

The particularly high percentage of "never" answers in Turkey is undoubtedly due to the less frequent use of alcohol in what is predominantly a Muslim country.

## Q11.1 How often do you combine tobacco with ... ? Answer: Alcohol

The chart below highlights several interesting differences for certain sociodemographic variables.

Younger people and those who have studied the longest seem more likely to combine tobacco and alcohol.

Male smokers (63\%) are more likely than women (47\%) to combine tobacco and alcohol, but that situation is probably linked to more frequent consumption of alcohol by men.

The alcohol-tobacco combination is frequent with all the socio-professional categories, except among people looking after the home and retired people.

### 4.2. Tobacco and medicines

## -A majority of smokers never or only rarely combine tobacco and medicines-

If the percentage of answers in the "never" and "rarely" categories are taken into account, it appears that a majority of smokers do not combine these two substances in most countries.

The medicine-tobacco combination varies very appreciably from one country to the next. More than $70 \%$ of citizens in Hungary (76\%), Slovakia (72\%) and Luxembourg (71\%) never combine tobacco and medicines.

On the other hand, $62 \%$ of Irish citizens, $60 \%$ of Spanish citizens and $59 \%$ of British citizens declare that they combine tobacco and medicines, even if only rarely. Moreover, at least $20 \%$ of citizens in Sweden (21\%) and Malta (20\%) combine these two substances very frequently.

In the candidate and accession countries, a strong majority of Turkish citizens (78\%), inhabitants of the Turkish Cypriot Community (74\%), and Rumanians (67\%) declare that they never mix medicines and tobacco.

The frequency of this combination is undoubtedly linked to the level of the consumption of medicines in each of these countries.

## Q11.2 How often do you combine tobacco with ... ? Answer: Medicines

The chart below highlights a significantly more important combination of medicines and tobacco among the oldest respondents and retired people, which is logical given the latter's very strong consumption of medicines.

As a corollary it is not surprising that this combination is less frequent among the youngest respondents and students.

Finally, there is no difference between men and women on this point.

### 4.3. Tobacco and drugs

## -A rare combination in most Member States-

A strong majority of smokers in all the countries participating in this survey declare that they never combine tobacco with drugs.

However, it is to be noted that one in four Italian smokers and one in five Spanish smokers combine these two substances, even if only rarely. Approximately 5\% of smokers in Spain (6\%), Italy (4\%), the United Kingdom (4\%) and Belgium (4\%) declare that they combine these two substances very often. It would be interesting to compare these results with the use of cannabis or other drugs in those countries.

Q11.3 How often do you combine tobacco with ... ? Answer: Cannabis or any other drug

The chart below, representing the levels of "never" replies, highlights perceptible differences with regard to this combination in the different categories studied.

The lowest scores (that is to say in the categories combining most frequently these substances) are to be found among men, the youngest respondents, students and finally those who roll their own cigarettes. Once again, these results should be examined in the light of the use of cannabis by these categories.

## 5. Anti-tobacco campaigns

### 5.1. The impact of anti-tobacco campaigns

Questionnaire source: Q13- filtered question

## -More than 80\% of smokers or former smokers can recall an anti-tobacco campaign-

In the European Union, more than eight ${ }^{8}$ out of ten respondents (83\%) declare that they remember an anti-tobacco campaign encouraging people to stop smoking.

In 23 of the 25 European Union Member States, the percentage is close to or exceeds $70 \%$ and is almost $95 \%$ in Denmark and Finland. On the other hand, Lithuania (51\%) and Estonia (43\%) stand out by the lower percentage of citizens who remember having heard or seen an anti-tobacco campaign.

Except in Bulgaria (45\%), a clear majority of the people interviewed in the candidate and accession countries declare that they remember hearing or seeing an anti-tobacco campaign.

Q13 Do you remember hearing or seeing any tobacco campaign encouraging people to quit smoking?

[^7]On the whole, the levels of positive replies in the accession and candidate countries are lower than the EU average. Although the levels in Croatia (81\%) and Turkey ( $79 \%$ ) are fairly close to that average, the level, as was noted above, is considerably lower in Bulgaria (45\%).

An analysis of the results from a socio-demographic point of view does not reveal any really perceptible differences between the different categories studied. It is to be noted, however, that the respondents who studied the longest are more likely to remember having heard or seen an anti-tobacco campaign.

### 5.2. The effectiveness of anti-tobacco campaigns

Questionnaire source: Q14 - filtered question
The aim of the last question was to measure the opinion of respondents who remember having heard or seen an anti-tobacco campaign - either smokers or former smokers - regarding the effectiveness of those campaigns as regards their personal tobacco consumption.

## -Neither smokers nor former smokers have been really convinced by anti-tobacco campaigns-

At European level, 68\% of respondents declare that anti-tobacco campaigns have not made them want to give up smoking.

## Q14 Did any of these tobacco campaigns make you want to

 quit smoking?

In almost all the Member States, as well as in the accession and candidate countries, the various anti-tobacco campaigns do not seem to have made either smokers or former smokers want to give up smoking. Ireland is the only country where a majority of respondents declare that anti-tobacco campaigns have encouraged them to quit smoking. Citizens in the Netherlands (87\%) and Sweden ( $84 \%$ ) are the most sceptical about the effectiveness of the various campaigns.

The socio-demographic variables do not reveal any appreciable differences on this question. It is to be noted, however, that people who smoke cigars or a pipe seem less sensitive than other smokers to anti-tobacco campaigns.

Q14 Did any of these tobacco campaigns make you want to quit smoking? Answer: No

## 6. Conclusion

The number of smokers in the European Union has fallen sharply over the last three years. The results of the survey carried out in 30 countries or territories in autumn 2005 show that in the $\mathbf{1 5}$ old European Union Member States, the percentage of smokers has fallen appreciably since the previous survey in 2002 (carried out only in the EU15). The number of smokers of packed cigarettes has fallen by 7 points ( $33 \%$ ), the number of citizens declaring that they have never smoked has increased by 5 points ( $47 \%$ ) and the proportion of smokers who declare that they have stopped smoking has also increased by 3 points (22\%).

As in 2002, there are still very significant differences in tobacco consumption across Europe. Changes in consumption patterns vary considerably from one Member State to another. Although in a majority of countries, consumption has fallen, in others it has changed relatively little.

The answers of smokers to the questions regarding their smoking habits reveal that most smokers are regular smokers as opposed to occasional smokers. In all the Member States, more than $\mathbf{9 0 \%}$ of smokers declare that they smoke every day. On the other hand, the quantity of cigarettes smoked varies considerably in Europe. In the European Union, the number varies, for example, from 12.2 cigarettes in Slovakia to more than 23 in Greece. In comparison to 2002, this quantity has fallen in a majority of the 15 old Member States. This reduction is also more perceptible among women and young people.

Among the places where people smoke, four out of five European smokers smoke at home and a small majority smoke when they are alone in their car. On the other hand, at European level smokers tend to show a certain consideration to nonsmokers and children by not smoking in their company in the car. More than three-quarters of smokers declare that they do not smoke in the company of children and almost $60 \%$ refrain from smoking in the company of non-smokers in the car. However, the level of consideration varies considerably from one country to the next.

Three-quarters of European Union citizens are aware of the health risks of tobacco smoke for non-smokers. Moreover, for $95 \%$ of EU citizens, smoking in the company of pregnant women can be very dangerous for the baby.

Although a majority of European Union citizens declare that they are rarely or never bothered by exposure to tobacco smoke in their daily life, this situation again varies considerably from one Member State to the next. It is interesting to note that the younger the respondents the more they seem to be bothered by tobacco smoke. If young people seem particularly sensitive to this unpleasant aspect, on the other hand the oldest respondents mentioned more frequently the physical symptoms or a recognised health condition caused by exposure to tobacco smoke. Overall, approximately one in two Europeans asks smokers not to smoke near them. However, once gain the level of tolerance towards smokers varies between countries.

More than $80 \%$ of European Union citizens are in favour of banning smoking in public places, both in workplaces and any other indoor public places. A majority of Europeans are also in favour of a ban on smoking in restaurants, bars and pubs. However, these opinions are less clear-cut and vary considerably from one country to another. Although a majority of smokers are in favour of a ban on smoking in restaurants, almost two-thirds of them seem to be against a ban on smoking in bars and pubs. Students and manual workers also stand out by their rejection of such a measure.

Finally, the measure of the visibility and effectiveness of anti-tobacco campaigns shows that in the European Union, more than $\mathbf{8 0 \%}$ of smokers and former smokers remember having heard or seen an anti-tobacco campaign. However, two-thirds of smokers and former smokers who remember such a campaign declare that they did not find it convincing. Moreover, the perceived effectiveness of such campaigns varies very sharply from one European Union Member State to another; while only one in ten smokers or former smokers in the Netherlands declares having been convinced at least to some extent by such campaigns, a majority of Irish citizens declare that they were convinced by them.

## Technical note

## SPECIAL EUROBAROMETER Nº239 <br> «Attitudes of Europeans towards tobacco » TECHNICAL SPECIFICATIONS

Between the $2^{\text {nd }}$ of September and the $6^{\text {th }}$ of October 2005, TNS Opinion \& Social, a consortium created between Taylor Nelson Sofres and EOS Gallup Europe, carried out wave 64.1 of the EUROBAROMETER, on request of the EUROPEAN COMMISSION, Directorate-General Press and Communication, Opinion Polls.

The SPECIAL EUROBAROMETER $N^{\circ} 239$ is part of wave 64.1 and covers the population of the respective nationalities of the European Union Member States, resident in each of the Member States and aged 15 years and over. The basic sample design applied in all states is a multi-stage, random (probability) one. In each country, a number of sampling points was drawn with probability proportional to population size (for a total coverage of the country) and to population density.

In order to do so, the sampling points were drawn systematically from each of the "administrative regional units", after stratification by individual unit and type of area. They thus represent the whole territory of the countries surveyed according to the EUROSTAT NUTS II (or equivalent) and according to the distribution of the resident population of the respective nationalities in terms of metropolitan, urban and rural areas. In each of the selected sampling points, a starting address was drawn, at random. Further addresses (every Nth address) were selected by standard "random route" procedures, from the initial address. In each household, the respondent was drawn, at random (following the "closest birthday rule"). All interviews were conducted face-to-face in people's homes and in the appropriate national language. As far as the data capture is concerned, CAPI (Computer Assisted Personal Interview) was used in those countries where this technique was available.

For each country a comparison between the sample and the universe was carried out. The Universe description was derived from Eurostat population data or from national statistics offices. For all countries surveyed, a national weighting procedure, using marginal and intercellular weighting, was carried out based on this Universe description. In all countries, gender, age, region and size of locality were introduced in the iteration procedure. For international weighting (i.e. EU averages), TNS Opinion \& Social applies the official population figures as provided by EUROSTAT or national statistic offices. The total population figures for input in this post-weighting procedure are listed above.

Readers are reminded that survey results are estimations, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits:

| Observed percentages | $10 \%$ or $90 \%$ | $20 \%$ or $80 \%$ | $30 \%$ or $70 \%$ | $40 \%$ or $60 \%$ | $50 \%$ |

## Remark :

Due to a problem in the translation of question 5 in Spain, people interviewed in September and October were re-contacted in order to put this question to them once again. The Spanish results presented in this report for this question are those observed during this recall.

# SPECIAL EUROBAROMETER ${ }^{\circ}$ 239 (2) <br> "Attitudes of Europeans towards tobacco" TECHNICAL SPECIFICATIONS 

Between the $5^{\text {th }}$ of November and the $7^{\text {th }}$ of December 2005, TNS Opinion \& Social, a consortium created between Taylor Nelson Sofres and EOS Gallup Europe, carried out wave 64.3 of the EUROBAROMETER, on request of the EUROPEAN COMMISSION, Directorate-General Press and Communication, Opinion Polls.

The SPECIAL EUROBAROMETER ${ }^{\circ} 239$ (2) is part of wave 64.3 and has been conducted in the two acceding countries (Bulgaria and Romania) and in the two candidate countries (Croatia and Turkey) and in the Turkish Cypriot Community. The survey covers the national population of citizens of the respective nationalities and the population of citizens of all the European Union Member States that are residents in those countries and have a sufficient command of one of the respective national language(s) to answer the questionnaire. The basic sample design applied in all states is a multi-stage, random (probability) one. In each country, a number of sampling points was drawn with probability proportional to population size (for a total coverage of the country) and to population density.

In order to do so, the sampling points were drawn systematically from each of the "administrative regional units", after stratification by individual unit and type of area. They thus represent the whole territory of the countries surveyed according to the EUROSTAT NUTS II (or equivalent) and according to the distribution of the resident population of the respective nationalities in terms of metropolitan, urban and rural areas. In each of the selected sampling points, a starting address was drawn, at random. Further addresses (every Nth address) were selected by standard "random route" procedures, from the initial address. In each household, the respondent was drawn, at random (following the "closest birthday rule"). All interviews were conducted face-to-face in people's homes and in the appropriate national language. As far as the data capture is concerned, CAPI (Computer Assisted Personal Interview) was used in those countries where this technique was available.

| $07 / 11 / 2005$ | $05 / 12 / 2005$ | 47.583 .830 |
|  |  |  |
| $09 / 11 / 2005$ | $26 / 11 / 2005$ | 157.101 |
| $07 / 11 / 2005$ | $05 / 12 / 2005$ | 76.264 .305 |

For each country a comparison between the sample and the universe was carried out. The Universe description was derived from Eurostat population data or from national statistics offices. For all countries surveyed, a national weighting procedure, using marginal and intercellular weighting, was carried out based on this Universe description. In all countries, gender, age, region and size of locality were introduced in the iteration procedure. For international weighting (i.e. EU averages), TNS Opinion \& Social applies the official population figures as provided by EUROSTAT or national statistic offices. The total population figures for input in this post-weighting procedure are listed above.

Readers are reminded that survey results are estimations, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits:

| Observed percentages | $10 \%$ or $90 \%$ | $20 \%$ or $80 \%$ | $30 \%$ or $70 \%$ | $40 \%$ or $60 \%$ | $50 \%$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Confidence limits | $\pm 1.9$ points | $\pm 2.5$ points | $\pm 2.7$ points | $\pm 3.0$ points | $\pm 3.1$ points |

Remark:
Due to a problem in the Bulgarian translation of question 5, this question was asked once again in Bulgaria in a Eurobarometer survey which took place between December 2005 and January 2006 (EUROBAROMETRE 64.4).
The results shown for this country in the report were collected during the 64.4 wave.

## Questionnaire

QC1 $\quad$ Which of the following applies to you?

```
(SHOW CARD - READ OUT - MULTIPLE ANSWERS POSSIBLE FOR CODES 1, 2, 3 AND 4)
```

| You smoke packed cigarettes | 1, |
| :--- | :--- |
| You smoke roll-up cigarettes | 2, |
| You smoke cigars or a pipe | 3, |
| You chew tobacco or take snuff | 4, |
| You used to smoke but you have stopped | 5, |
| You have never smoked | 6, |
| Other (SPONTANEOUS) | 7, |
| DK | 8, |
